

# Vietnam: Denmark helps Vietnam improve energy performance in buildings

**The LCTU has supported the Vietnamese Ministry of Construction in the process of defining a set of energy performance standards for buildings - and we will now support the implementation process quite extensively**

Danish support will include training and training materials for practitioners (architects, engineers and construction companies) as well as design advice for a number of demonstration buildings.

A competitive tender procedure for the main part of this work has just been completed. 14 tenderers from 7 countries applied for pre-qualification and four of them were considered in the final evaluation. A Danish-Vietnamese consortium won the tender in a neck-to-neck competition with 3 other consortiums led, respectively, by a German, a Canadian and another Danish consulting firm.

The winning consortium will begin work on the project in early January 2014.
