

New publication on Danish experiences with regulation and planning of district heating

The district heating (DH) system is a cornerstone in Denmark's green and efficient energy system. In that regard, the Danish Energy Agency recently published a paper on the successful Danish experiences with planning and regulation of DH to share with interested stakeholders. The new publication presents an overview of DH in Denmark and how the DH system, through its inherent flexibility, has been able to support different Danish energy policy ambitions over time, including targets on energy efficiency and renewable energy.

Please download the publication - which can also be found in Chinese - [here](#), or in the sidebar to your right
