

# Anholt/Djursland Offshore Wind Farm

## Geotechnical Investigations

### Cable Corridors

#### Geotechnical Report – CPT tests and vibrocores

GEO project no 32490  
Report 2, 2009-08-26

## Summary

Ramboll Wind has on behalf of Energinet.dk contracted GEO (Danish Geotechnical Institute) to conduct the geotechnical site investigations at the planned offshore wind farm between Anholt and Djursland.

The Anholt/Djursland Offshore Wind Farm worksite is located approximately 20 km off the coast of Djursland, north-east of the town Grenaa. The exact location of the farm is not yet established and several options are being assessed. The Anholt/Djursland Offshore Wind farm is planned as a 400 MW farm.

Power produced by the Wind Farm will be distributed via an approx. 20 km sea cable going to the shore of Djursland. The exact location of the cable is not yet established and therefore two options "Gjerrild Strand" and "Grenaa Nord" are being assessed.

The boring campaign in the wind farm area includes in total 7 boreholes to 40 metre below seabed. In addition to the sampling, in-situ testing (CPT tests) were carried out in the boreholes. Investigation of assumed deep gas was also included for a single location (BH08) in the scope of work.

For the cable corridors a total of 21 CPT tests and 21 vibrocores were executed. Both CPTs and vibrocores were planned to penetrate to 3 m below seabed.

All samples and cores from the boreholes and vibrocores have been geological described onshore. Classification-, chemical- and strength tests have been executed on selected samples.

This Report 2 summarizes the field- and laboratory work for the cable corridors and gives a general description of the geological and geotechnical variations along the corridors.

# 1 INTRODUCTION AND SCOPE OF REPORT

## 1.1 Project and site location

On the instruction and under the supervision of Rambøll, acting on behalf of Energinet.dk a geotechnical investigation has been carried out by GEO at the location for the planned Anholt/Djursland Offshore Wind Farm.

The Anholt/Djursland Offshore Wind Farm is planned as a 400 MW farm. The exact location of the farm is not yet established and several options are being assessed. The overall worksite is located approximately 20 km off the coast of Djursland, north-east of the town Grenaa. The worksite is depicted (orange area) in Figure 1.1 and measures approximately 144 km<sup>2</sup>. The water depth across the site generally ranges between 14 and 20 m.

*Figure. 1.1 Location of Anholt/Djursland Offshore Wind Farm*

Power produced by the Wind Farm will be distributed via an approx. 20 km sea cable going to the shore of Djursland. The exact location of the cable is not yet established and therefore two cable corridors are being assessed, a northern alignment, Gjerrild Strand and a southern alignment, Grenaa Nord.

The purpose of the geotechnical investigation is to gather adequate geological and geotechnical data for a preliminary technical assessment of the conditions for cable laying. The geotechnical investigation follows a geophysical campaign and the vibrocoring and CPT locations have been selected by the Client based on the results of this survey.

## 1.2 Geotechnical reporting under the contract

The performed geotechnical works for the Anholt/Djursland project are presented in totally 2 reports. The overall content of the 2 reports are:

**Report 1:** Wind Farm Area - Geotechnical Report – Boreholes (borehole logs, CPT profiles, laboratory results, soil conditions, summaries of work completed etc.).

**Report 2:** Cable Corridors – Geotechnical Report – CPT tests and vibrocores (vibrocore logs, CPT profiles, laboratory results, soil conditions, summaries of work completed etc.).

Report 3, which describes consolidation tests, is in progress.

## 1.3 Content of this report

This Report 2 includes factual field data and laboratory data and a interpretation of data from the vibrocores and CPTs performed for the two cable corridors.

# 2 FIELD OPERATIONS

## 2.1 General

The offshore geotechnical fieldwork was performed from the vessel Merete Chris.

Merete Chris was engaged between 26 May and 08 June, 2009. The operations were conducted on 12-hours basis. A summary of Daily Progress Reports is given in Enclosure 2B.04.

The following activities were carried out:

- 21 Nos. seabed deployed Piezocone Penetration Tests (PCPT)
- 21 Nos. vibrocores

All test locations are shown on the location plan, Enclosure 2A.01 and listed on the summary sheets, Enclosures 2B.01 and 2B.02.

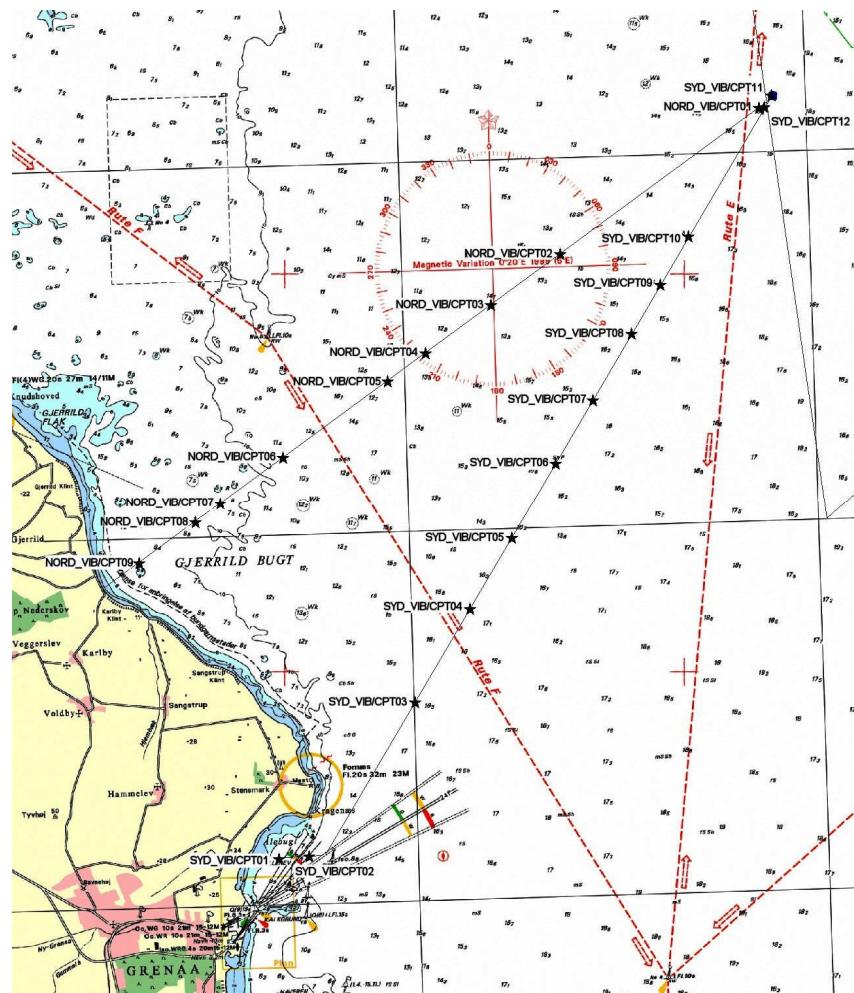

Figure 2.1 Schematic layout. Cable Corridors and test locations

## 2.2 Marine equipment

Merete Chris is a dredger vessel used for different marine works. The vessel has an overall length of 42.2 m and draught of 2.4 m and is equipped with a 530 HP main engine. On the vessel is installed a Senneborgen 640 R-HD 50 crane, which was used for handling the CPT and vibrocore equipment. The vessel was sub-contracted through Peter Madsen Rederi A/S in Denmark. The detailed data for the vessel is given in Appendix 2.I.

## 2.3 Vibrocore equipment and procedures

The vibrocores have been carried out from Merete Chris using the high-frequency vibrocore rig, Geo-Corer 3000. The rig is equipped with a sampler consisting of an open tube with anti flow-back valve, 3 m long, with a PVC 110/105 mm liner. The system description and technical data are included in Appendix 2.III.

The vibrocorer was operated using the crane on the vessel. A sample tube 3 m long was then vibrated into the seabed under observation of the penetration depth and speed. The crane recovered the equipment from the seabed to the deck, where the liner with sample was removed from the sample tube. The vibrocores were planned to penetrate to maxi-

mum 3 m below seabed. The actual penetration depth was measured with a counter, mounted on the vibrocoring rig.

The sample was cut into sections of approx. 1 m length. On each top-end of the sample section a preliminary soil description has been performed. Each section was then sealed with end caps and PVC tape. All samples were shipped onshore to GEO's laboratory for geological description and testing.

All data from the fieldwork (penetration depth, core length, core recovery, record of collected samples) are given in the Summary – Vibrocores and on the vibrocoring logs, Enclosures 2D.01 – 2D.21

## 2.4 CPT equipment and procedures

Piezoelectric Cone Penetration Tests (PCPTs) have been carried out from Merethe Chris using GEO's seabed CPT-rig "GeoLight". A general description and technical specification for the GeoLight is presented in Appendix 2.II.

All the CPTs were planned to penetrate to maximum 3,0 m depths below seabed. The penetration depths, coordinates, seabed levels and stop reasons for each test are listed in Summary – CPT tests, Enclosure 2B.01.

The overall GeoLight system dimensions are; base plate 1.6 x 1.6, height 1.6 m with a ballast of approximately 5 ton providing 30 kN thrust at seabed.

The CPT's were conducted in accordance with the ISOPT1 (1988), ref /3/. Tip resistance, sleeve friction, pore water pressure (single filter located just behind the cone tip) and inclination of the cone were recorded during each test. The cones used were of the standard Van den Berg 60-degree type with cross sectional areas of 10 cm<sup>2</sup>. The cone geometry, filter and sleeve diameter, joint-widths and rods were in agreement with the ISOPT1 recommendations.

All cones were calibrated in accordance with the contract specification and GEO procedures. The cone calibration data are enclosed in Appendix 2.II.

## 2.5 Comments to field work

On location SYD\_VIB01 it was not possible to penetrate deeper than 1,0 m with the vibrocoring rig due to the presence of soft rock (limestone). The CPT test at the location was also stopped after approx. 1 m penetration and the cone (080917) was damaged. A reattempt (SYD\_CPT01B) was performed to substitute the failed test.

## 2.6 Navigation and positioning

### 2.6.1 Datum and coordinate system:

Co-ordinates for all positions are given according to WGS84, UTM Zone 32.

All depths refer to DVR 90.

### 2.6.2 Equipment and procedures:

All positioning work have been based on the positioning system on Merete Chris. The system is a PDS2000 via Trimble 5700 DGPS system. The key reference point is the GPS antenna placed on the top of the crane boom (central above test positions).

To verify the accuracy of the positioning systems on board the Merete Chris a position check was performed during the mobilisation. The test performed is stored in GEOs project files.

Water depths on the test positions have been established using a transducer on Geo-Light. Seabed elevations have been established using the recorded water depths in conjunction with sea levels recorded by the automatic water level gauges in Grenaa Harbour. The seabed elevations for the vibrocore has been assumed identical to the nearby CPT.

Positions and seabed elevations for the vibrocores and CPT tests are given in the Summaries, Enclosure 2B.01 and 2B.02, vibrocore logs, Enclosure Nos. 2D.01 - 2D.21 and on the CPT profiles, Enclosure Nos. 2E.01 - 2E.21 and Enclosure Nos. 2F.01 - 2F.21.

## 3 Geological descriptions and logs

All cores have been geologically described at GEOs laboratory in Lyngby. The geological description follows the specifications in Bulletin No. 1 "A guide to engineering geological soil description" from Danish Geotechnical Society (DGF), ref. /1/.

Soil encountered, stratification, soil classifications etc. in the individual vibrocore are given on the vibrocore logs, Enclosure 2D.01 - 2D.21.

Legend and Abbreviations, used on the vibrocore logs is enclosed as Enclosure 2C.00.

## 4 LABORATORY WORK

### 4.1 Testing program and standards

All cores have been sent to GEOs laboratory in Lyngby for testing.

Prior to commencing the onshore tests, GEOs suggested program for laboratory testing was commented on and accepted by Ramboll.

In Table 4.1 is listed the type of tests done on the project and standards used for the individual tests:

| Type of test  | Test standard                              |
|---|--|
| Natural moisture content  | EN1997-2:2005(E) - BS1377                  |
| Particle size analysis (sieve & hydrometer analysis)                                      | EN1997-2:2005(E) - BS1377                  |
| Atterberg limits (liquid limit, plastic limit and plasticity index) – Falling Cone Method | EN1997-2:2005(E)<br>DS/CEN ISO/TS 17892-12 |
| Unit weight   | EN1997-2:2005(E) - BS1377                  |
| Density of solid particles  | EN1997-2:2005(E) - BS1377                  |
| Density index of granular soils ( $e_{min}/e_{max}$ )                                     | Etc 5 - Draft                              |
| Carbonate content   | EN1997-2:2005(E) - BS1377                  |
| Loss on ignition (organic content)  | ASTM D2974                                 |
| Thermal conductivity test   | ASTM D5334-92                              |

Table 4.1 Reference to laboratory test standards

## 4.2 Soil Tests

### 4.2.1 Natural moisture content

Natural moisture content determination was made on regular intervals in cohesive formations. Natural moisture content is also determined on all samples, where Atterberg limits are determined.

The results of the natural moisture content determinations are given on the vibrocore logs, Enclosure Nos. 2D.01 - 2D.21. Natural moisture content determinations are also presented on the Summary - Soil Classification Tests, Enclosure 2B.03.

### 4.2.2 Liquid and plastic limit

Liquid and plastic limit determinations (Atterberg limits) were made on selected samples in order to classify the plasticity of the materials.

The results of the determinations are given on the vibrocore logs, Enclosure Nos. 2D.01 - 2D.21 and are also presented on the Summary - Soil Classification Tests, Enclosure 2B.03.

### 4.2.3 Particle size analysis

Particle size analyses were undertaken on samples by sieving only or a combination of sieving and sedimentation.

The detailed results from the sieve- and sedimentation tests are presented on the Particle Size Distribution Curves, Enclosure 2G.01-2G.20. The percentage of clay (< 0,002 mm) is also presented in the Summary - Soil Classification Tests, Enclosure 2B.03.

#### 4.2.4 Organic content

Determination of the organic content of soil was done for selected soil samples.

The results of the organic content determinations are given on Summary - Soil Classification Tests, Enclosure 2B.03.

#### 4.2.5 Carbonate content

Determination of the calcium carbonate content was done on a number of the soil samples.

The results of the carbonate content determinations are given on Summary - Soil Classification Tests, Enclosure 2B.03 and on the vibrocoring logs, Enclosure Nos. 2D.01 - 2D.21.

#### 4.2.6 Thermal conductivity tests

This test method, which presents a procedure for determining the thermal conductivity of soil and soft rock using a transient heat method, has been undertaken on totally 7 samples. All samples were located within the first metres below seabed.

The results of the conductivity tests are presented in Enclosure 2H.01 - 2H.07.

### 4.3 Comments to laboratory work

Laboratory tests have been performed as ordered in the extent possible. Due to local soil variations within the core a few of the tests have been executed at slightly different depths than planned.

Effort has been made to ensure that geological descriptions are in agreement with results of classification tests, following the guidelines of the standards. All classification testing was carried out after the geological description, and descriptions of samples selected for classification testing were then compared with test results and adjusted, if necessary. Depending on a geological evaluation, descriptions of samples close to the sample tested were sometimes also adjusted.

## 5 Measured CPT data

The results of all measured data by CPTs are presented on the CPT logs, Enclosure 2E.01 - 2E.21. Legend and definitions for the logs are presented in Enclosure 2C.00.

The following data are presented for each test:

1. Cone resistance,  $q_c$
2. Sleeve friction,  $f_s$
3. Pore water pressure,  $u$
4. Friction ratio,  $R_f$

An explanation of the abbreviations used in the processing is given below:

- $q_c$  is the measured cone resistance.  $q_c$  is shown as two curves; one corresponds to a low range scale (e.g. 0-5 MPa) and one to a high range scale (e.g. 0-50 MPa)
- $f_s$  is the measured sleeve friction
- $u$  is the pore water pressure (relative to seabed level)
- $R_f$  is the friction ratio. Friction ratio is the ratio between the measured sleeve friction and the measured cone resistance i.e.,  $R_f = (f_s/q_t)100\%$

## 6 Inferred CPT data

### 6.1 General

The results of all inferred data from the CPTs are presented on the CPT Profiles, Enclosure Nos. 2F.01 - 2F.21. Legend and definitions for the logs are presented in Enclosure 2C.00.

The following data are presented for each test:

1. Corrected cone resistance,  $q_t$
2. Corrected sleeve friction,  $f_t$
3. Corrected friction ratio,  $R_{ft}$
4. Pore pressure ratio,  $B_q$
5. Normalised cone resistance,  $Q_t$
6.  $F_r = f_s / (q_t - \sigma_{vo})$
7. The angle of internal friction  $\varphi$
8. The undrained shear strength,  $c_u$
9. Relative density,  $D_r$

An explanation of the abbreviations used in the processing is given below:

- $q_t$  is the corrected cone resistance. The values are shown in two scales, 0-5 MPa and 0-50 MPa. The corrected cone resistance is defined by  

$$q_t = q_c + (1-a) \cdot u \text{ where } a = 0.75$$
- $f_t$  is the corrected sleeve friction
- $R_{ft}$  is the corrected friction ratio. Friction ratio is the ratio between the measured sleeve friction and the corrected cone resistance i.e. where  $R_{ft} = f_s/q_t$
- $B_q$  is the pore pressure ratio. 
$$B_q = \frac{u - u_0}{q_t - \gamma \cdot Z} \text{ where } \gamma = 20\text{kN/m}^3$$
  - [ $u_0$  is the insitu, hydrostatic pore pressure (relative to seabed level)]
- $Q_t$  is the normalized cone resistance. The normalized cone resistance is defined by  $Q_t = (q_t - \sigma_{vo}) / \sigma'_{vo}$  where  $\sigma'_{vo}$  = effective vertical stress
- $F_r = f_s / (q_t - \sigma_{vo})$

### 6.2 Interpretation of soil types

On basis of our general experience the interpretation of geotechnical soil types have automatically been generated based on the model below:

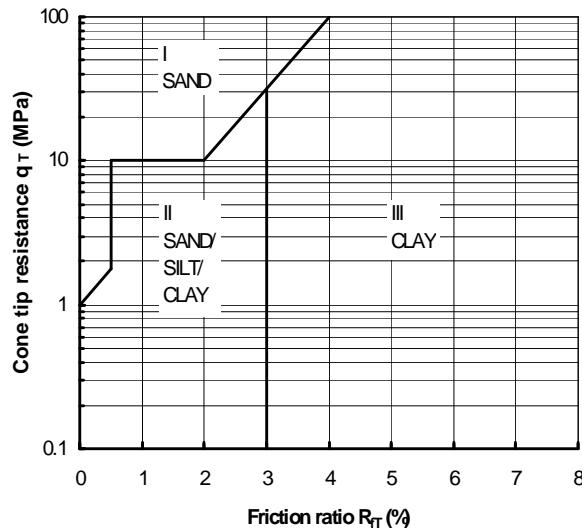

Figure 6.1 Empirical geological model for Anholt/Djursland Wind farm

The automatically generated soil types are not adjusted later with information obtained from the vibrocores, hence, the soil types included on the CPT profiles are based on the CPT data alone.

Interpretations of soil types for the different locations are presented on the CPT Profiles, Enclosure Nos. 2F.01 - 2F.21.

### 6.3 Strength Parameters

#### 6.3.1 Undrained Shear strength:

The undrained shear strength have be determined from:

$$c_u = (q_t - \sigma_{vo})/N_{kt}$$

The undrained shear strength ( $c_u$ ) have be calculated by the cone factor values  $N_{kt}$  10 and 20 representative of the actual soil (both values are shown on the enclosures).

The undrained shear strength ( $c_u$ ) presented is presented on the CPT Profiles, Enclosure Nos. 2F.01 - 2F.21.

#### 6.3.2 Angle of internal friction:

The angle of internal friction  $\varphi'$  is determined from the relative density ( $D_r$ ) determined from the CPT tests by the use of the expression:

$$\varphi' = \alpha \cdot D_r + \beta$$

where

$$\alpha = 0.14^\circ \text{ and } \beta = 28.0^\circ \text{ (} D_r \text{ given in percent)}$$

This equation yields the maximum value  $\varphi' = 42.0^\circ$  for  $D_r = 100\%$ .

The equation is based upon Figure 5.53 for uniform fine sand (Schmertmann, 1978) in "Cone Penetration Testing in Geotechnical Practice", ref. /2/.

The internal friction  $\varphi'$  is presented on the CPT Profiles, Enclosure Nos. 2F.01 - 2F.21.

Relative Density:

The relative density ( $D_r$ ) is estimated by the below expression, valid for normally and overconsolidated sands:

$$D_r = \frac{1}{C_2} \cdot \ln \left[ \frac{q_c}{C_0 \cdot (\sigma'_{v0})^{C_1}} \right] \cdot 100\% \quad \text{where } q_c \text{ and } \sigma'_{v0} \text{ is given in kPa}$$

and  $C_0 = 181$ ,  $C_1 = 0.55$ ,  $C_2 = 2.61$

The equation is based upon Figure 5.47 in "Cone Penetration Testing in Geotechnical Practice", ref. /2/.

The relative density ( $D_r$ ) is presented on the CPT Profiles, Enclosure Nos. 2F.01 - 2F.21.

## 7 DESCRIPTION OF GEOLOGICAL AND GEOTECHNICAL CHARACTERISTICS ENCOUNTERED

### 7.1 Geological characteristics

Overview of the geological soil types encountered along the cable route are listed in Table 7.1.

| <b>Soil type</b>                    | <b>Description</b>                                   | <b>Environment and age</b> |
|-------------------------------------|--|----------------------------|
| Marine postglacial sand             | with shells and/or gravel                            | Ma Pg                      |
| Marine postglacial clay             | Highly plastic, w %>60                               | Ma Pg                      |
| (Late-) glacial sand                | with silt, clay, iron sulphides, organic             | MaMw LgGc                  |
| (Late-) glacial clay                | with laminae, iron sulphides, organic, gravel grains | MaMw LgGc                  |
| Limestone (Only position SYD_VIB01) | Silty, sandy w. unhardened parts                     | Ma? Da?                    |

Table 7.1. Overview of geological soil types along cable corridors

### 7.2 Geotechnical characteristics

For each investigation point the test results (both laboratory and CPT tests) have been listed and related to the corresponding geological soil type to form a "mini database" of the geotechnical parameter variation. From this database typical values or ranges of the

geotechnical parameters have been identified and tabulated. The values extracted are presented in Table 7.2.

For the limestone it has not been possible to establish typical values of the geotechnical parameters since this formation is only found at the position SYD\_VIB01.

The form of presentation is not a statistical work up of all data in each of the selected point leading to determination of characteristic design values for each soil type, since that work up is beyond the scope of this contract. The presentation is meant as guide to get a quick overview of the geotechnical parameter variation for each geological soil type to be used only for initial engineering purposes.

| <b>Geotechnical characteristics</b>                             |      | <b>Geotechnical soil type</b>  |                                |                             |                             |
|---|------|--------------------------------|--------------------------------|-----------------------------|-----------------------------|
|   |      | <b>Marine postglacial sand</b> | <b>Marine postglacial clay</b> | <b>(Late-) glacial sand</b> | <b>(Late-) glacial clay</b> |

Table 7.2. Soil types – Classification parameters and strength parameters

Notes:

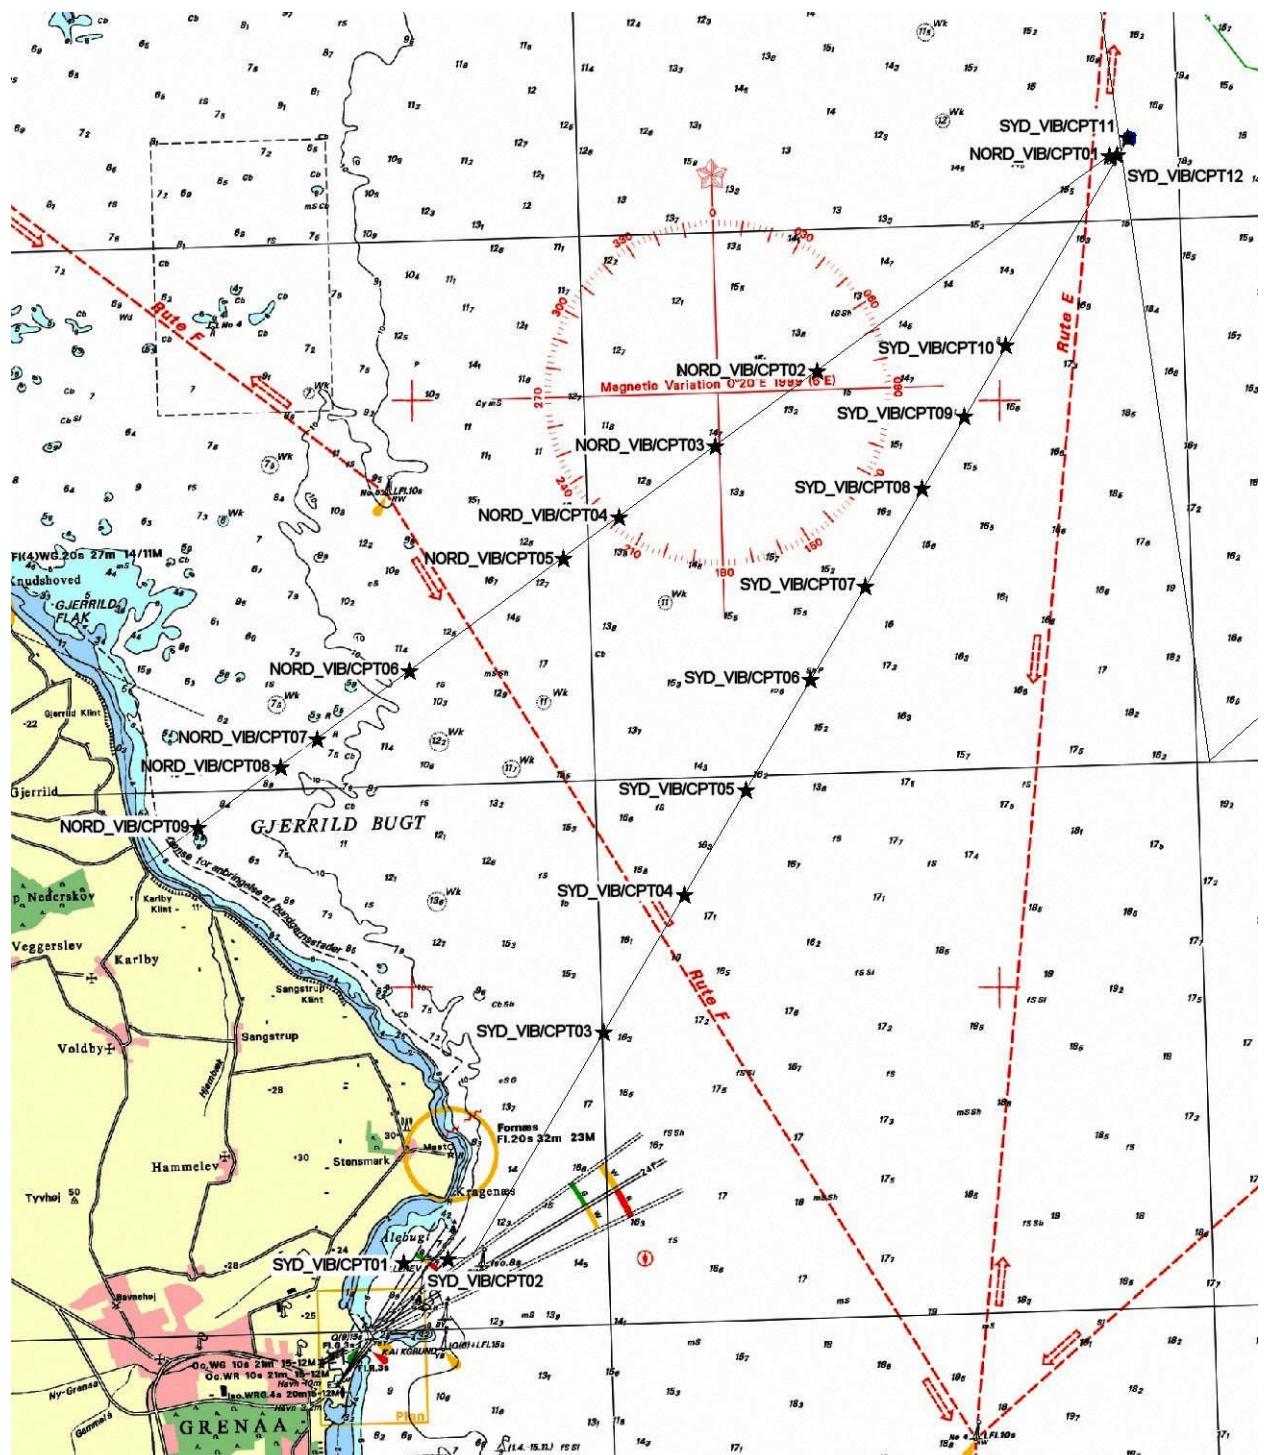

#1: Higher U values recorded on some samples due to high gravel content

## Summary – Daily Progress Reports

| Date       | Activity   |
|------------|--|
| 2009-05-26 | Mobilisation of vibrocore equipment on MS Merete Chris. Transit Hundested to Grenaa.   |
| 2009-05-27 | Performed Vibrocores: SYD VIB01, SYD VIB02, SYD VIB03, WOW.  |
| 2009-05-28 | WOW.   |
| 2009-05-29 | Performed vibrocores: SYD VIB04, SYD VIB05, SYD VIB06, SYD VIB07, SYD VIB08, SYD VIB09, SYD VIB10.   |
| 2009-05-30 | Performed vibrocores: NORD VIB09, NORD VIB08, NORD VIB07, NORD VIB06, NORD VIB05, NORD VIB04, NORD VIB03, NORD VIB02, NORD VIB01.                    |
| 2009-05-31 | Performed Vibrocores: SYD VIB11, SYD VIB12.  |
| 2009-06-02 | Performed CPTs: SYD CPT 02, SYD CPT 01, WOW  |
| 2009-06-03 | WOW  |
| 2009-06-04 | WOW  |
| 2009-06-05 | WOW  |
| 2009-06-06 | Performed CPTs: SYD CPT 03, SYD CPT 04, SYD CPT 05, SYD CPT 06, SYD CPT 07, SYD CPT 08, SYD CPT 09, SYD CPT 10, NORD CPT 01, SYD CPT 12, SYD CPT 11. |
| 2009-06-07 | Performed CPTs: NORD CPT 02, NORD CPT 03, NORD CPT 04, NORD CPT 05, NORD CPT 06, NORD CPT 07, NORD CPT 08, NORD CPT 09, SYD CPT 01B.                 |
| 2009-06-08 | Demobilisation of equipment in Hundested harbor.   |
|            |  |

## Core drillings

### Site plan

### Soil types

|  |                             | Samples | Well installations     |
|--|-----------------------------|---------|------------------------|
|  | Fill                        |         | Bag sample (disturbed) |
|  | Mull                        |         | Top level              |
|  | Peat                        |         | Concrete               |
|  | Peaty mud                   |         | Backfill               |
|  | Gyttja                      |         | Seal                   |
|  | Organic matter              |         | Filter sand            |
|  | Shells                      |         |                        |
|  | Clay till (sandy, gravelly) |         |                        |

Note: In tills, a varying content of stones and blocks should be expected

### Geological age

|    |               |
|----|---------------|
| Re | Recent        |
| Pg | Postglacial   |
| Sg | Lateglacial   |
| Gc | Glacial       |
| Ig | Interglacial  |
| Te | Tertiary      |
| Mi | Miocene       |
| Ol | Oligocene     |
| Eo | Eocene        |
| Pl | Palaeocene    |
| Se | Selandian     |
| Da | Danian        |
| Ct | Cretaceous    |
| Ms | Maastrichtian |

### Environment

|    |                        |
|----|------------------------|
| Ae | Aeolian (wind deposit) |
| Br | Brackish water deposit |
| Fi | Fill                   |
| Fw | Fresh water deposit    |
| Gl | Glacier deposit        |
| Ls | Landslide deposit      |
| Ma | Marine deposit         |
| Mw | Meltwater deposit      |
| Ss | Solifluction soil      |
| Ts | Topsoil                |
| Wd | Wash down deposit      |

### General abbreviations

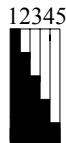

|        |                  |
|--------|------------------|
| sl.    | slightly         |
| v.     | very             |
| w.     | with             |
| lam.   | lamina(e)        |
| fragm. | fragments        |
| biot.  | bioturbation     |
| bryo.  | bryozoans        |
| calc.  | calcareous       |
| glauc. | glaconite        |
| T      | top of sample    |
| B      | bottom of sample |

## Core samples

Recovery: Ratio in percentage between sample length and length of core run (Total Core Recovery, TCR). Value appears at top of core.

RQD: Rock Quality Designation. Ratio in percentage between total length of core pieces with length more than 100 mm, and length of core run. Value appears at top of core.

### Fractures:

|        |                    |                                 |
|--------|--------------------|---------------------------------|
| 1 = S1 | Unfractured        | no fractures                    |
| 2 = S2 | Slightly fractured | < fracture spacing              |
| 3 = S3 | Fractured          | 6 cm < fracture spacing < 10 cm |
| 4 = S4 | Very fractured     | 2 cm < fracture spacing < 6 cm  |
| 5 = S5 | Crushed            | fracture spacing < 2 cm         |

### Induration:

|        |                         |                                   |
|--------|-------------------------|-----------------------------------|
| 1 = H1 | Unlithified             | Can easily be shaped with fingers |
| 2 = H2 | Slightly indurated      | Can easily be worked with knife   |
| 3 = H3 | Indurated               | Can be worked with knife          |
| 4 = H4 | Strongly indurated      | Can be scratched with knife       |
| 5 = H5 | Very strongly indurated | Cannot be scratched with knife    |

## Tests

|            |                                 |                      |   |  |
|------------|---------------------------------|----------------------|---|--|
| $c_v$      | Shear strength                  | (kN/m <sup>2</sup> ) | Measured by vane test in undisturbed soil   | vr.: Vane not penetrated to full depth |
| $c_{vr}$   | Shear strength                  | (kN/m <sup>2</sup> ) | Measured by vane test in remoulded soil   | vd.: Test with defective vane          |
| $c_l$      | Shear strength                  | (kN/m <sup>2</sup> ) | Measured by laboratory vane   | st.: Vane test influenced by stone     |
| $c_u$      | Shear strength                  | (kN/m <sup>2</sup> ) | Measured by unconfined compression test or triaxial test  |  |
| N          | Standard Penetration Test (SPT) |                      | Number of blows per 0.3 m penetration of Ø51 mm SPT probe by use of the energy $h \cdot G = 0.7 \text{ m} \cdot 0.635 \text{ kN}$ |  |
| w          | Water content                   | (%)                  | Ratio between weight of water and weight of grains  |  |
| $w_p$      | Plastic limit                   | (%)                  | Water content at the boundary between semisolid and plastic state; NP: Non plastic  |  |
| $w_L$      | Liquid limit                    | (%)                  | Water content at the boundary between plastic and liquid state  |  |
| $I_p$      | Plasticity index                | (%)                  | $w_L - w_p$   |  |
| $\gamma$   | Unit weight                     | (kN/m <sup>3</sup> ) | Ratio between total weight and total volume   |  |
| e          | Void ratio                      |                      | Ratio between pore volume and grain volume  |  |
| $e_{\max}$ | Void ratio, loosest state       |                      | Void ratio of very loose standard state   |  |
| $e_{\min}$ | Void ratio, densest state       |                      | Void ratio of very dense standard state   |  |
| $I_d$      | Relative density                |                      | $(e_{\max} - e) / (e_{\max} - e_{\min})$  |  |
| ka         | Carbonate content               | (%)                  | Ratio between weight of carbonate and total grain weight  |  |
| gl         | Organic content                 | (%)                  | Weight loss by prolonged glowing, in percent of total grain weight  |  |

## Supplementary tests

| In situ tests:  | Laboratory tests:           |    |                        |  |
|-----------------|-----------------------------|----|------------------------|--|
| PR Pressiometer | B Brazil                    | P  | Point Load             |  |
| FH Falling Head | C Consolidation             | S  | Simple shear           |  |
| PP Pumping      | D Specific gravity          | T  | Triaxial               |  |
| EL Elastmeter   | E $e_{\max}$ and $e_{\min}$ | U  | Unconfined compression |  |
| GA Gammalog     | F Photo                     | V  | Shear box              |  |
|                 | G Grain size analysis       | W  | Vibration compaction   |  |
|                 |                             | SP | Standard proctor test  |  |
|                 |                             | MP | Modified proctor test  |  |

Vane tests are carried out and evaluated according to reference document, revision 3, August 1999 (in Danish), of the Danish Geotechnical Society. Conversion tables have been approximated by a straight line through the origin and the point corresponding to  $\frac{2}{3} P_{\max}$ .

## Cone Penetration Tests

- 01 Depth: Depth refers to the penetration depth below start of test level. The depth is not corrected for tool inclination
- 01 Level: Level to penetration depth
- 02  $q_c$ : Tip resistance in two scales, 0 – 10 MPa and 0 – 100 MPa
- 03  $f_s$ : Sleeve friction in scale 0 – 0.5 Mpa. All measurements are referred back to the cone tip
- 04 u: Pore water pressure relative to level at start of test in scale -0.5 – 2.0 MPa
- 05  $R_f$ : Friction ratio in scale 0 – 6 %
- 06 Other test information
- E and N: Test location (E: Easting and N: Northing)
- Date: Date of CPT testing
- Cone no: Number of cone used in test
- Cone type: Type of Cone – TSP. Tip resistance, Sleeve friction and Pore water pressure are measured in agreement with the ISOPT1 recommendations
- Cone area: 10.0 cm<sup>2</sup> in agreement with the ISOPT1 recommendations
- Rig: Name of rig
- Performed by: Initial of test operator
- Remarks: Remarks to test (If any)

## Cone Penetration Tests

- 10 Depth: Depth refers to the penetration depth below start of test level. The depth is not-corrected for tool inclination
- 10 Level: Level to penetration depth
- 11  $q_t$ : Corrected tip resistance in two scales, 0 – 10 MPa and 0 – 100 MPa
- 12  $f_t$ : Corrected sleeve friction in scale 0 – 0.5 MPa
- 13  $Q_t$ : Normalized cone restistance in scale 0 - 1000
- 14  $F_r$ : Normalized sleeve friction in scale 0 – 10 %
- 15  $\phi$ : Angle of internal friction in scale 20 - 45°
- 16  $c_u$ : Undrained shear strength in scale 0 – 500 kPa
- 17  $D_r$ : Relative density in scale 0 – 100 %
- 18  $B_q$ : Pore pressure ratio in scale -0.5 – 2.0
- 19  $R_{ft}$ : Corrected friction ratio in scale 0 – 10 %
- 20 Main soil description interpreted from CPT results
- 21 Other test information:
- E and N: Test location (E: Easting and N: Northing)
- Date: Date of CPT testing
- Cone no.: Number of cone
- Cone type: Type of Cone – TSP. Tip resistance, Sleeve friction and Pore water pressure are measured in agreement with the ISOPT1 recommendations
- Cone area: 10 cm<sup>2</sup> in agreement with the ISOPT1 recommendations
- Rig: Name of rig – SCOPE2008
- Performed by: Initials of test operator
- Remarks: Remarks to test (if any)

### Arbejdsudstyr:

Sennebogen 640 R-HD 50 ton kran  
Standard udstyr: Bom 16,0 m. Gravedybde indtil 35,0 m. Grab 2,5 m<sup>3</sup>  
Tandgrab. Fladgrab. Polypgrab.

Støtteben 2 stk, forankrer indtil 9,5 m dybde  
4 stk. hydrauliske varspil med 3,5 ton træk  
Capstane agter med 3,5 ton træk  
Motorbåd 55 HK

Option – Elektronisk positionering med RTK  
GPS og PMS positioneringssoftware

### m.s. "MERETE CHRIS" er velegnet til:

- Molebyggeri og stenarbejder
- Planerings- og bundsikringsarbejder
- Oprænsnings- og uddybningsarbejder
- Rørlægnings- og dykkerarbejder
- Rammearbejder
- Mange former for entreprenør arbejde i øvrigt

**Appendix 2.II**  
**Datasheet - CPT Equipment and Cone Calibration Data**  
**(9 pages)**

**Description:**

GeoLight is a marine CPT rig designed for 4-ton effective CPT ballast for working at water depth up to 100 m. The rig has a hydraulic wheel drive system and the online registration of all parameters gives a safe and controlled operation

**System set-up:****GeoLight:**

Umbilical cable  
Control Unit for GeoLight  
Data acquisition package

**Option:**

Tension winch with umbilical

**GeoLight:****Dimension:**

|                  |                       |
|------------------|-----------------------|
| L x W x H:       | 1.6 m x 1.6 m x 2.0 m |
| Weight in air:   | 5 ton                 |
| Weight in water: | 4 ton                 |

**Specification:**

|                      |   |
|----------------------|---|
| Thrust system:       | Hydraulic wheel drive system<br>10 cm <sup>2</sup> CPT rods |
| Thrust capacity:     | 40 kN   |
| Rate of penetration  | 20 mm/sec   |
| Operation depth      | Up to 100 m   |
| Online registration: | Penetration depth, penetration rate and cone readings       |
| Power supply:        | 440 VAC/60 Hz, 18 kW and stable 220 V                       |
| Lifting wire:        | Min. 20 mm  |

**Umbilical**

Standard Scorpio  
Cable type: 6169

**Control Unit for GeoLight**

Standard PC with 2 serial RS 232 Ports and GEO's software for rig control.

**Data acquisition packet**

Standard PC with GEO's data acquisition software, with online display of data.

Data stored in GEO format. Printout of results in field and conversion to ascii form. CPT set-up in accordance with ISSMFE Procedures 1988.

# Kalibreringscertifikat

Type : CPT Sonde (TSP)  
Fabrikat : A.P. Van den Berg  
Serienummer : 080914

## Spidstryk

|                           |   |             |
|---------------------------|---|-------------|
| Dato for kalibrering      | : | 16-09-2008  |
| Hældningskoefficient      | : | 13.134 kN/V |
| Skæringspunkt på y-aksen  | : | -0.377 kN   |
| Nedre grænseværdi (Lower) | : | -7.666 V    |
| Øvre grænseværdi (Upper)  | : | 7.666 V     |
| Delta (Zero value)        | : | 0.152 kN    |
| Zero                      | : | -0.003 V    |
| Gain                      | : | 2.338 V     |
| Gain - zero               | : | 2.341 V     |
| Nominel belastning        | : | 50.000 MPa  |
| Maksimum belastning       | : | 100.000 MPa |

## Kappemodstand

|                           |   |            |
|---------------------------|---|------------|
| Dato for kalibrering      | : | 17-09-2008 |
| Hældningskoefficient      | : | 4.812 kN/V |
| Skæringspunkt på y-aksen  | : | -0.210 kN  |
| Nedre grænseværdi (Lower) | : | -4.200 V   |
| Øvre grænseværdi (Upper)  | : | 4.200 V    |
| Delta (Zero value)        | : | 0.012 kN   |
| Zero                      | : | -0.001 V   |
| Gain                      | : | 2.338 V    |
| Gain - zero               | : | 2.339 V    |
| Nominel belastning        | : | 0.750 MPa  |
| Maksimum belastning       | : | 3.000 MPa  |

## Poretryk

|                           |   |             |
|---------------------------|---|-------------|
| Dato for kalibrering      | : | 17-09-2008  |
| Hældningskoefficient      | : | 0.449 MPa/V |
| Skæringspunkt på y-aksen  | : | 0.005 MPa   |
| Nedre grænseværdi (Lower) | : | -0.233 V    |
| Øvre grænseværdi (Upper)  | : | 3.103 V     |
| Delta (Zero value)        | : | -0.001 MPa  |
| Zero                      | : | 0.001 V     |
| Gain                      | : | 0.512 V     |
| Gain - zero               | : | 0.511 V     |
| Nominel belastning        | : | 4.000 MPa   |
| Maksimum belastning       | : | 6.000 MPa   |

**Appendix 2.III  
Datasheet – Vibrocore Equipment**

**(4 pages)**

### Applications

- Stratigraphic Studies
- Geological Mapping
- Mineral Exploration
- Environmental Surveys
- Pollution Investigations
- Geotechnical Investigations

### High Frequency Vibration

The Geo-Corer 3000 + 6000 is a high frequency, electrically driven, vibrocorer system capable to penetrate fast into all common seabed sediments ranging from compact sands to stiff clays and even unconsolidated chalk.

### Proven Performance

The Geo-Corer 3000 + 6000, has a well-known record of over 20 years proven performance.

### Small Vessel Operation

The Geo-Corer 3000 + 6000 can be deployed from a small vessel and is easy to handle. Thanks to its lightweight construction and smart pull-out system, it requires a limited hoisting power of 5 tons maximum, when working in stiff clays.

### Operational Features

- High frequency Vibration
- Proven Performance
- Small Vessel Operation
- Reliable & Cost Effective
- Easy to Handle & Modular
- Pivoting Barrel Head
- High Quality Cores

### Variable Coring Parameters

The standard configuration is designed for taking cores of 6 m length in ordinary PVC liners with an internal diameter of 106 mm.

The system can be easily modified for taking shorter cores of 3 m.

The force on the cutting shoe can be adjusted using different dead weights on the vibro-unit.

### Pivoting Core Barrel Head

The pivoting head allows rapid change of the core barrel and easy retrieval of the liner, while the vibro corer remains in up-right position

### **Reliable & Cost Effective**

Its straightforward concept and high quality construction guarantee a simple and reliable operation with a minimum of maintenance.

### **Easy to Handly and Modular Construction**

The Geo-Corer 3000 + 6000 has been designed so that all structural parts can be handled by human force.

This feature is not only reflected in a very short rig-up and rig-down time, but also in low transportation costs.

### **High Quality Cores**

The fast penetration rate results in high-quality cores with a minimum of disturbance.

## Technical Specifications

|   |   |
|---|---|
| Type                                    | Geo-Core 6000 / 3000  |
| Manufacturer                            | Geo-Resources Instruments   |
| Max Weight in Air                       | approx. 1000 - 1200 kg depending on deadweights in use  |
| Max Weight in Water                     | approx. 850 - 1050 kg depending on deadweights in use   |
| Fully Containerized System              | The system is designed to fit into a standard 20-foot container. The same container is used for storage of barrels and liners during operation offshore.  |
| Total Height (6 m barrel configuration) | 7.2 m   |
| Total Height (3 m barrel configuration) | 4.4 m   |
| Footprint (6 m barrel configuration)    | diameter 4.6 m  |
| Footprint (3 m barrel configuration)    | diameter 2.8 m  |
| Corrosion Protection / maintenance      | All structural steel parts are hot dip galvanized, Core barrels made of stainless steel 316   |
| Vibro Unit                              | electrically driven (5 kW) double vibrator  |
| Vibrating Frequency                     | 28 Hz   |
| Vibrator Swing Force                    | 3   |
| Dead Weights on Vibrator Unit           | 0 kN<br>adjustable: 150 - 300 kg  |
| Electric Power                          | 380 VAC, 3 phase, 50 Hz<br>Starting power 25 A<br>Running Power 8 A   |
| Electric Umbilical                      | 12 leads of 1.5 mm <sup>2</sup> for power and controls<br>Kevlar reinforced, PU insulated, OD 16 mm<br>High quality (Hydrovolt) underwater connectors   |
| Electric Umbilical Cable Reel           | Optional for shallow water operations < 100 m<br>Mandatory for deep water operations > 100 m<br>stainless steel electrical cable reel with integrated connector<br>diameter reel 0.9 m, width reel 0.5 m      |
| Electrical Control Unit                 | Electric Power control by Ampere meter<br>Automatic switch-off, when fully penetrated<br>Optional: depth transducer   |
| Core Barrel                             | ID/OD: 111mm/ 121mm, Stainless Steel 316<br>Length: 6 m, or 3 m<br>Core Catcher (Stainless Steel 316)<br>Replaceable Cutting Shoe (Carbon Steel)<br>Special anti flow-back valve<br>Pivoting core barrel head |
| Core Liner                              | ID/OD: 105 mm / 110 mm, PVC<br>Length 6 m or 3 m  |
| Operational Depth                       | standard 600 m, greater depth range is optional   |
| Hoisting Requirements                   | maximum 5 ton, when operated in stiff clays or hard soils<br>a torsion-free steel cable, diameter 12 mm is sufficient<br>N.B. Provision of hoisting cable is optional   |
| Minimum Height below A-frame            | 8.5 m for the 6 m barrel configuration<br>5.5 m for the 3 m barrel configuration  |

## Main Mechanical Components

(numbers refer to parts in figures)

| no | description            | material, comment                        |
|----|------------------------|--|
| 1  | basement               | hot-dip galvanised, can folded together  |
| 2  | guiding poles          | high strength steel                      |
| 3  | sliding frame          | hot-dip galvanised,                      |
| 4  | dead weights           | adjustable, up to 6 pieces.              |
| 5  | rigging head           | hot-dip galvanised,                      |
| 6  | stays                  | stainless steel 316                      |
| 7  | vibrator unit          | three-phase AC motor                     |
| 8  | barrel pivot           | hot-dip galvanised / stainless steel     |
| 9  | springs                | reinforcing vibration motion to 30 kN    |
| 10 | core barrel            | ID/OD 113 x 121 stainless steel 316      |
| 11 | pivoting barrel head   | stainless steel 316                      |
| 13 | cutting shoe           | replaceable, carbon steel                |
| 14 | core catcher           | stainless steel, tulip type, replaceable |
| 15 | anti-return valve      | Delrin / stainless steel                 |
| 16 | liner                  | PVC tube ID/OD 106 x 110                 |
| 17 | guiding block          | HMPE                                     |
| 18 | hoisting wire rope     | anti-torsion 12 mm steel cable           |
| 19 | underwater power cable | PU kevlar-inforced                       |

The vibrocorer main structure consists of: the basement (can be folded together during transportation) (1), the two guiding poles (2), the sliding frame (3) with vibrator (7) and up to six dead weights (4) allowing to adjust the downward penetration force.

Both guiding poles (2) are connected at the top by a rigging head (5), which are re-enforced by stainless steel stays (6) to the basement (1).

The vibrator unit (7) is powered by a three-phase AC motor. It is freely moving in vertical direction with its sliding frame (3) in between the guiding poles (2) and is coupled by the springs (9) in both directions.

The barrel (10) made of stainless steel is connected with the barrel pivot (8) by two locking bolts (11) allowing to put the barrel in a horizontal position when the liner (16) is extracted.

The barrel (10) is provided with the cutting shoe (13), which fixes the core catcher (14) in its position. In conjunction with the anti-return valve (15) on the top of the barrel (10), this prevents the core from moving backwards while pulling it out of the bottom.

A PVC liner (16) is used to recover the core.

The guiding block (17) guides the barrel (10) in the basement (1). It is positioned in the basement via a flap.

The steel wire (18) and the powersupply cable (19) are used to deploy the vibrocorer from the vessel.

The electric motor of the vibrator (7) is operated (switch on/off) via the power supply cable (19) and the control unit.

The required hoisting power while drawing the barrel (10) out of the seabed is reduced by the fourfold reduction of the steel hoisting cable (18).
