

Benthic flora and fauna - data

Kontor/afdeling
Havvind

Dato
03-10-2024

J nr. 2022 - 21092

This note explains why raw data for benthic flora and fauna is made available to potential bidders without an accompanying technical report. In connection with the feasibility study program for the North Sea Energy Island project a survey of benthic flora and fauna was undertaken.

Unfortunately, the sampling program and the subsequent methods and analyses were not sufficient to comply with the purpose of the task, which was to describe the existing benthic conditions in the area based on a flat extension methodology with substrate type maps and overlying habitat type maps. However, the collected raw data is of high quality and can be used as a supplement for future studies, which is why the collected data is made available to potential bidders and other particularly interested parties.
